

MEHMET GÖRKEM TEZEN

As a Computer Engineering graduate, my focus goes beyond just writing code; I am dedicated to creating solutions that streamline business processes and generate real value. Throughout my professional journey, I have had the opportunity to develop custom software for enterprise ERP systems and modernize existing applications using technologies such as Python, C#, and .NET. My experience in database management and ERP workflows has given me a strong perspective on building data-centric, high-performance applications. Driven by a genuine curiosity for modern libraries and frameworks, I am eager to take on responsibility in complex projects and contribute meaningfully to a forward-thinking team.

EXPERIENCE

DATABASE ENGINEER & ERP SPECIALIST

Koyuncu Grup (April 2021 - Present)

- ERP Optimization & Custom Solutions: I manage the end-to-end operational processes of the Logo ERP system. In cases where standard features do not meet business requirements, I develop custom software using C# and Visual Basic to digitize and streamline workflows.
- Database Architecture: I optimize database performance on MS SQL Server. By designing advanced View and Stored Procedure structures to manage complex datasets, I ensure secure and high-speed data processing.
- Smart Reporting & Automation: I create strategic SQL-based reports for finance and accounting departments. Additionally, I operate an "internal audit" system by establishing SQL Job mechanisms that detect erroneous transactions and automatically assign tasks to relevant personnel to ensure zero errors in declaration processes.
- Process Automation: To eliminate manual data entry via Excel, I develop integration tools that provide XML data transfer. Through these solutions, I achieve 100% accuracy in data transfer processes and provide significant time savings.

IT Intern

Koyuncu Grup (July 2019 - september 2019)

- Infrastructure & Network Management: I took an active role in the installation and development of network systems to strengthen the company's technological infrastructure.
- Network Solutions: I gained hands-on experience in infrastructure projects by providing technical support during the design and implementation of high-performance, secure network solutions to enhance operational efficiency.

Software Developer Intern

İttifak Holding (July 2018 - August 2018)

- Web Modernization: I played a role in restructuring an existing dynamic web page originally built with JavaScript into a more modern and efficient architecture using C# and .NET technologies to meet current business requirements.
- Performance & User Experience: I contributed to enhancing system performance by applying modern software practices to minimize page load times and create a smoother user interface.
